

Sprint 3 Increment - Backend & Frontend Development

I started this sprint by improving my version control on Git. I did this because in a meeting with our PO, he said that he didn't want multiple versions of, for example, the class diagram. So I deleted the old ones and started working on one that matches all the information in the database. It wasn't until later that it was finished.

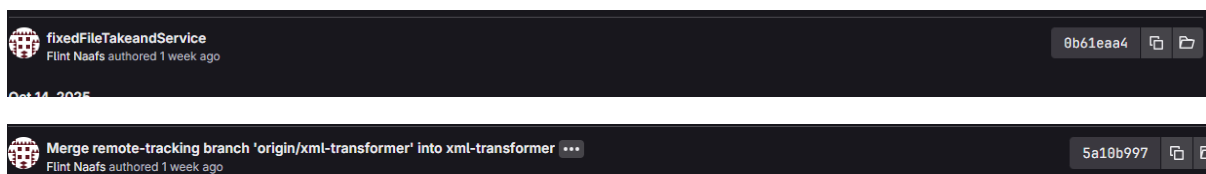

Backend Development: Parser, Controller & Service

So I started making the parser, the controller, and the service:

<https://gitlab.fdmci.hva.nl/semester-3-hbo-ict/onderwijs/student-projecten/2025-2026/out-s-t-se/suuzaameebaa24/-/commit/0b61eaa403085bc929766e7edb83bd1a2a2b7959>

After some merging, I made more small changes to the parser and controller to improve functionality.

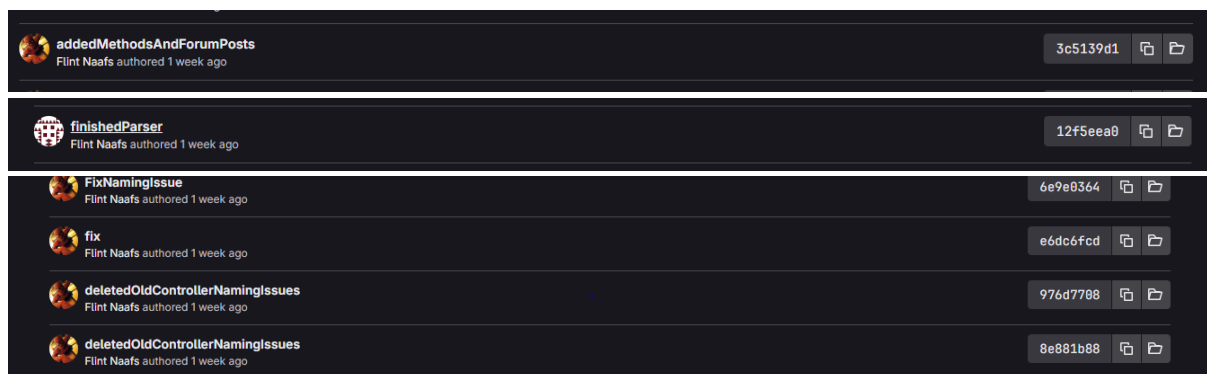

Updating the Class Diagram

Then I went back to the class diagram and noticed forum posts and methods were missing, so I added those:

<https://gitlab.fdmci.hva.nl/semester-3-hbo-ict/onderwijs/student-projecten/2025-2026/out-s-t-se/suuzaameebaa24/-/commit/3c5139d1dc53bfabf0673799adbba18177b18629>

Then I did some debugging on the naming issues within the XML controller. After that, the parser was finished, but the DB was far from set up.

Fixing Merge Issues

Then I encountered some merging issues from merging the parser branch into the main branch, so I had to fix that:

<https://gitlab.fdmci.hva.nl/semester-3-hbo-ict/onderwijs/student-projecten/2025-2026/out-s-t-se/suuzaameebaa24/-/commit/f7076084d025ddea71086dea531c89eec5189f54>

Frontend Development: Routing & Views

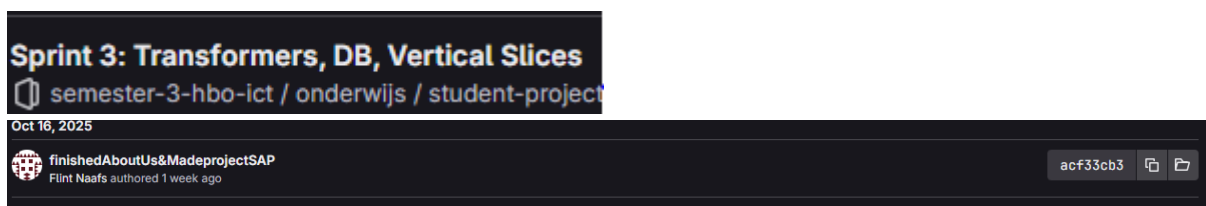

Then, maybe because of the merge issues, I started moving over to the front-end and trying to fix some stuff there. I started with the routing and creating the different views (map, about us, stemwijzer).

Vertical Slice - Sprint Goal

Then I did a vertical slice, which was our sprint goal. I made the whole project SPA, which means that it doesn't load the whole project again when you click a navigation link, but only some components change. I also made the About Us page just like the wireframe:

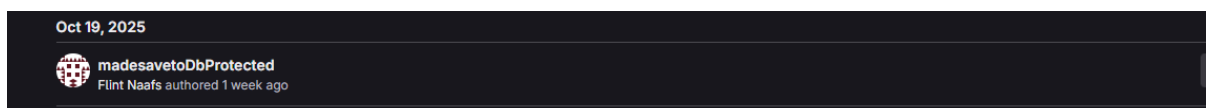

<https://gitlab.fdmci.hva.nl/semester-3-hbo-ict/onderwijs/student-projecten/2025-2026/out-s-t-se/suuzaameebaa24/-/commit/acf33cb3e8df9484c0f3d665cc56af1310ff2a41>

Database Models

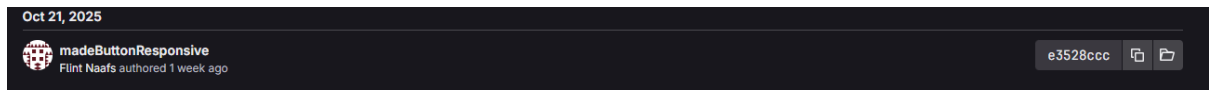

Made the models so we have the DB fully functional.

Then I made sure the saveToDatabase() function was protected, so it couldn't be accessed from outside

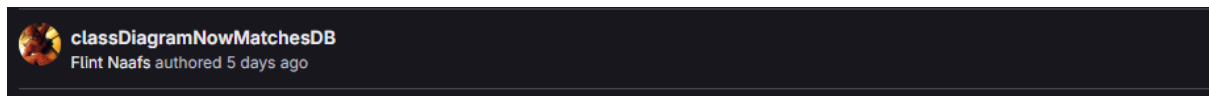

Technical Slice - Responsive Design

Then I went back to the front-end and made sure that the buttons, but actually everything, is now responsive, which is a technical slice as well, I think.

Finalizing the Class Diagram

Then I made sure the class diagram was finished (after 6 tries). It now precisely matches the data in the database.

Collaboration with Stefan - Security

I worked together with Stefan on a lot of the backend and parser. He was working on the JWT token for security, but he forgot to put the JWT secret, so I did that. I also made sure the XML file you can upload is bigger than 2MB, for bigger XML uploads

Connecting Backend to Frontend

Then I finally started the connection from backend to frontend. I started making electionservice.ts and changing map.vue so it would display the data.

And that is where I am now, trying to get ALL the data on the map page. I am trying to debug that right now.

Partijresultaten

Partij	Stemmen	Percentage
VVD	0	—
D66	0	—
GROENLINKS / Partij van de Arbeid (PvdA)	0	—
PVV (Partij voor de Vrijheid)	0	—

Conclusion Sprint 3

This sprint went well overall. I completed our main sprint goal, the vertical slice with SPA functionality, which really improved the user experience.

What went well was the collaboration with Stefan on the backend and getting everything responsive. What was challenging were the merge conflicts, which took more time than expected. Looking back, I should've solved them immediately instead of switching to frontend work. Also, the class diagram took 6 tries, but now it perfectly matches the database.

Right now I'm debugging the data display on the map page. Next sprint, I want to finish this connection and improve my Git workflow to prevent merge conflicts.

Overall, I'm happy with the SPA implementation, but there's still work to do on the backend to frontend connection.
